

Abstract of the Disclosure:

The invention relates to an image generation device (1), particularly a 3D camera. The inventive image generation device (1) is designed in order to obtain small dimensions and 5 to take thermal considerations into account. The camera (1) has at least one, in particular, rigid first printed board (10) for highly complex semiconductors such as a microcontroller (11), memory (12), etc. with at least one optical image recording sensor (50), and has a second printed 10 board (20) for all other components such as, in particular, large capacitors, transistors, resistors, coils (21) or plugs (22), etc. The first (10) and second (20) printed boards are mounted on, preferably glued to, a metallic base plate (40). The inventive image generation device (1) advantageously 15 comprises, at least in the area of its optics modules (50, 51, 52, 53), a minimum overall height thus making it particularly well-suited for use as a built-in component serving as an occupant recognition unit in the roofliner, as a lane-change assistant in the exterior rearview mirror or for similar 20 applications or installation locations in a motor vehicle even in locations where extreme installation conditions exist and prior art camera systems fail.
